TITLE: Pathogenicity of intestinal bacteria and their resistance to the bactericidal effect of the alimentary fluids

SOURCE: Kiserletes Orvostudomany, v. 17, no. 1, 1965, 77-81

TOPIC TAGS: bacteria, bacteriology, pathology, biochemistry, gastroenterology, digestive system, bactericide, immunology

ABSTRACT:
The destruction of intestinal bacteria in different fluids of the alimentary canal (primarily in the gastric fluid of achlorhydric patients and in the intestinal fluid of healthy and achlorhydric patients) has been studied under acid conditions (pH 2). It has been determined that all of the *E. coli* strains freshly isolated from pathological processes show a considerable resistance to the bactericidal effect of the acid, in achlorhydric gastric fluids. This resistance is lost after serial culture passages and returns only after inoculation into animals. Only a fraction (about one-half to one-third) of the freshly isolated *Shigella*, *Klebsiella* and *Proteus* strains possessed resistance similar to that of *E. coli*. The *Salmonella* strains examined, however, became de-

"Immunothyroiditis Cases."

Budapest, Orvosi Hetilap, Vol 107, No 11, 13 Mar 66, pages 491-494.

Abstract: [Authors' Hungarian summary] The more important observations related to the symptomatology, pathomechanism and diagnosis of immunothyroiditis are described in connection with a case observed. The interest in the case was evoked by the simultaneous presence of some other autoimmune process as well and by the accompaniment of the immunothyroiditis by a thyrotoxic crisis. 4 Hungarian, 41 Western references.

Title : Arsenometric Determination of Oxalate Ions.

Orig Pub: Magyar kem. folyoirat, 1958, 64, No 3, 96-97.

Abstract: An arsenometric method of oxalate ion determination based on the oxidation of oxalate ions with bromine and the titration of the excessive bromine with arsenite solution was developed. 10 ml of 2 n. HCl is added to 10 to 20 ml of 0.1 n. bromidebromite solution containing 15 to 20 g of KBr per liter, after which 7.5 ml of 5 n. NaOH solution, the oxalate solution under study (about 5 to 10 ml of 0.1 n

1995 Cardiotonic effect of some substances on the isolated frog heart

A HISTORY OF

✓ 2504 Preparation of cardiotonic extracts from tissues and their
biary. J. Knoll L. Tardos E. Komlósi R. Klemenc and I. Balázsi
Acta physiol Acad Sci Hung. 1933 & 193 208 (Pharmacol Inst
Med Univ Budapest Hungary). The tissue are extracted with
hot water the extract is evaporated to a small volume and 10% gelatin
added at 60°. The activity can be found in the prep. Some modi-
fications of this basic procedure are described. The activity
was measured in the biphasic frog heart and heart-lung prep.
There were great variations in the activity of the prep. best results
were obtained from spleen liver and r.b. Cats and dogs yielded
more active prep than horses. Some of the prep were active on
both others on one of the 2 assay objects. The active prep contain
Ca. When Ca is removed the prep loses its activity. Re-addition
of Ca restores activity. Insorg Ca in quantities equal to the Ca
content of the prep has little or no effect. Herman.

BALÁZSY L. *Ergänzung zu Vol. 11/5 Surgery May 1957*

2225. (481) BALÁZSY L. Inst. für Anat., Histol. und Embryol., Med. Univ., Debrecen, Ungarn. *Experimentelle Beeinflussung der Gewebequalität des Amputationsstumpfes, Beiträge zur Wirkung äusserer Faktoren auf die Regeneration. Experimental influence on the quality of the tissue of the amputation stump. The effect of external factors on regeneration ACTA BIOL. ACAD. SCIENT. HUNG. (Budapest) 1955, 6/1-2 (133-147) Tables 1 Illus. 11

In 47 rats, either high amputations halfway the femur or low amputations at the level between the lower and middle third of the tibia were carried out in the left posterior leg. The rats which underwent the latter operation walked on their stumps 3 to 4 days postoperatively. Young rats of 3 to 4 weeks are compared with adult specimens of more than 2 months. In a first series (A), muscles and skin were firmly sutured after amputation. In group B, only the skin is sutured, but firmly, and in groups C the skin alone is loosely sutured. These different types of suturing were applied to study the effect of the pressure brought about by the suture. None of the high-amputation rats showed chondrogenesis at the stump; in 80% of the high-amputation rats, adult as well as young rats, there was chondrogenesis. In a second series, which served as a control examination, low amputation was applied, and the limb sutured to the abdominal wall to prevent walking on the stump. There was no chondrogenesis at the stump. In a last series, E (5 rats aged 12 days), amputation was carried out 2 mm. above the

2225

CONT.

distal growing centre of the femur according to Lacroix. In 3, there was no chondrogenesis at all, in 1 slight chondrogenesis and in 1 chondrogenesis as described by Lacroix. The conclusion is reached that chondrogenesis at the end of the amputation stump of the leg is due to external factors, such as pressure. In group E, the enchondral bone formation is explained by residual epiphyseal cartilage in the region of the stump.

SOV/137-57-1-1448

Translation from: Referativnyy zhurnal. Metallurgiya, 1957, Nr 1, p 192 (USSR)

AUTHORS: Balbasheva, N. M., Bocharov, S. P.

TITLE: Effect of Impurities and of the Heat-treatment Process on the Mechanical Properties of the AL9 Alloy (Vliyaniye primesey i rezhima termicheskoy obrabotki na mekhanicheskiye svoystva splava AL9)

PERIODICAL: Tekhnol. transp. mashinostroyeniya, 1956, Nr 4, pp 22-27

ABSTRACT: The authors investigated the effect of Cu, Fe, Mn, and Zn on the properties of AL9 alloy. After quenching from 535°C and aging at 160° σ_b does not change with an increase in the Cu content from 0.08 to 0.84%; the hardness increases insignificantly; δ decreases from 5 to 2% upon an 0.08 to 0.35% increase in Cu content, but does not change thereafter. The mechanical properties of the specimens in the cast state are virtually identical with those obtaining after quenching. An increase in Fe content > 0.65% brings about a sharp decrease in δ and σ_b which phenomenon is explained by the separation of Fe silicide. Mn content up to 0.75% has no effect on the mechanical properties of the alloy.

6270. THE EFFECTIVENESS OF MEDICAL GYMNASTICS IN THE TREATMENT SCHEDULE OF SCIATICA AT THE HEALTH RESORT OF KEMERI (Russian text) - Balbeko
V. F. • TRUD, INST, EKSPER, MED, AKAD. NAUK LATV. SSR 1956, 12 (89-111)
227 patients with sciatica were investigated. The treatment prescribed was: hydrogen sulphide baths (on alternate days), mud applications (for 2 days in succession followed by an interval of 1 day), medical gymnastics, massage (in some cases), injections of proserine, and physiotherapeutic procedures. In prescribing a treatment one has to be guided by the pathogenesis and the duration of the disease. In cases with a recent exacerbation (not more than 6 months ago) one has to be careful. In sciatica of traumatic origin or resulting from an influenza-like infection the results of treatment are better than in cases resulting from chills. The medical gymnastics heighten considerably the effect of balneotherapy. A differentiated system of treatment schedules is recommended: 1st schedule - for patients who have incurred an exacerbation not later than 6 months before admission; 2nd schedule - for patients of the 1st group after the reaction to balneotherapy has worn off and also for patients with a mild pain syndrome; 3rd schedule - is ordered for patients of the two preceding groups who have improved considerably after treatment and also for patients admitted with only residual manifestations of sciatica and a mild pain syndrome. TITLE: Coherent instability of betatron oscillations in
accelerators and particle collectors

19

SOURCE: Atomnaya energiya, v. 19, no. 2, 1965, 126-131

TOPIC TAGS: particle accelerator, particle beam

ABSTRACT: The purpose of this article is to present a theoretical analysis of coherent vertical oscillations initiated in the accelerator cycle. The causes provoking these oscillations and consequently a coherent instability were examined and the time needed for the development of these phenomena was evaluated. The problem of damping conditions was also considered. A dispersion equation was derived for coherent vertical oscillations with respect to the centre of gravity of accelerated particle beams. This disclosed that the finite

2

limited conductivity of chamber walls could lead to a hazardous instability. In conclusion, the maximum admissible number of injected particles was considered from the point of view of the coherent vertical stability. It is stated that for the proton synchrotron of the Dubna Institute such number was about 10^{14} while for the synchrocyclotron of the Academy of Science Physics Institute this maximum number was about 10^{12} . TITLE: Stability of transverse oscillations of a focused charged beam in an absorbing medium

SOURCE: Zh eksper i teor fiz, v. 50, no. 6, 1966, 1529-1536

TOPIC TAGS: charged particle, ion beam focusing, betatron, plasma interaction, gas ionization, oscillation

ABSTRACT: The transverse stability of a focused beam of charged particles moving through an absorbing medium has been investigated. The various modes of coherent oscillations (center of gravity, size, and shape) have been determined and their frequencies and increments found. The possibility of stabilizing the beam by exploiting the energy and nonlinearity of the betatron oscillation has been analyzed.

TITLE: Influence of conductivity of the walls of an accelerating chamber or a storage ring on the oscillations of the dimensions and shape of the beam

SOURCE: Atomnaya energiya, v. 20, no. 3, 1966, 270-271

TOPIC TAGS: charged particle, particle accelerator, storage ring, electron beam, electric conductivity

ABSTRACT: The stability of an accelerated charged beam is analyzed in a chamber of rectangular cross section. By means of a method developed in an earlier paper (Atomnaya energiya v. 19, 126, 1965) it is shown that if the midplane of the beam coincides with the midplane of the chamber and the beam width is much larger than its thickness, the nonequilibrium charge density occurring under the influence of the beam's own field can be readily determined in terms of the charge, mass, and linear density of the particles and the parameters of the chamber. This makes it possible to obtain an equation for the longitudinal component of the electric field and the conditions under which instability sets in. The equations show that the higher-moment oscillations become significant if the beam thickness is comparable with the height of the chamber and their influence increases also on approaching nonlinear resonance. Consequently the higher-moment oscillations can become dangerous in strong focusing systems. The

instability can be eliminated by producing energy scatter and nonlinearity in the oscillations, the same as in the case of the oscillations of the center of gravity of the beam. Orig. art. has: 4 formulas.

Title : Prophylaxis of Anemia in Suckling Piglets. Preliminary Report

Orig Pub : Med. weteryn. 1955, 11, No 1, 41-42

Abstract : Research was conducted to determine the cause of large scale morbidity among suckling piglets. Autopsies revealed acute pale color of the mucosa and the surrounding membranes, dilation of the heart, and modifications characteristic of exhaustion in older piglets. An investigation of the blood of suckling piglets has shown that a considerable drop in the Hb and erythrocytes in the blood takes place already during the first week

AUTHOR: Balbyshev, I.N., (Pushkin, Leningrad Oblast')

TITLE: "Weeping" of Plants ("Plach" Rasteniy)

VOL. 47,

PERIODICAL: Priroda, 1958, Nr 5, pp 114 - 115 (USSR)

ABSTRACT: Maple and birch trees of the South Urals were observed in the area of the town of Asha in the Chelyabinsk Oblast' with respect to their sap flow. Similar conditions were found in the adjacent Gafuriy region of the Bashkir ASSR. The flow started between 22 March and 5 April on the south slopes when there was still deep snow. It ended between 24 April and 7 May. On the north slopes it began between 4 and 17 April and ended between 29 April and 12 May. The period of flow was 33 days on the south and 25 days on the north slopes. Also the total amount and sugar content of the south-slope maple sap is higher. The intensity of flow varies with the temperature. It is highest during the first afternoon hours of fine weather. Sunny days and cold nights are the most favorable condition. Sudden cold spells, fog and alternating cold and warm weather in daytime reduces the flow. The intensity of the flow also depends on the advanced stage of the

Card 1/2

"Weeping" of Plants

26-58-5-42/57

opening of buds and leaves, and the presence of insects and butterflies. A wild sacharomycete was discovered in the sap under microscope. This explains why the sap turns sour and flocculates so soon. The Endomyces vernalis bacterium causes a slimy coagulation.

TITLE: Dates of Development of the Plants of the North (Sroki raz-vitiya rasteniy severa)

PERIODICAL: Priroda, 1958, Nr 8, pp 127-128 (USSR) ⁴⁷

ABSTRACT: The article deals with the vegetative period of diverse plants of the tundra and forest tundra. It stresses the riches of these regions in mushrooms and many kinds of wild berries. Spring development sets in suddenly when there is still a snow cover everywhere. The summer high of temperature there is 35°, while frosts may start in the middle of August, although there are very warm September months on record. The compressed decisive period for the overground development of the plants of the North yields phenomena of quasi overnight growth, plants simultaneously without buds, with buds and in bloom and other particularities. There are 2 photos and 1 Soviet reference.
